OLAOSEBIKAN ISRAEL

Backend Developer & System Architect

Phone: 08161396891 | Email: theizzylogic@gmail.com | GitHub: github.com/Adejareisrael

EDUCATION

University of Lagos Lagos, Nigeria

B.Sc. Computer Science (in progress) — CGPA: 4.20/5.0

Relevant Courses: Data Structures and Algorithms, Automata Theory, Operating Systems, System Design, Networking, Calculus.

SKILLS

Languages: JavaScript (ES6+), TypeScript.

Frameworks & Runtimes: Node.js, Express.js, React.js, Mongoose.

Databases: PostgreSQL, MongoDB, Redis.

Cloud & DevOps: Cloudflare (R2 buckets), Backblaze, Docker, Nginx, GitHub Actions, PM2, Vercel, Render, UptimeRobot.

Concepts & Architecture: REST APIs, RBAC, State Machines, Unit & Integration Testing, Database Partitioning, Background Jobs, CI/CD.

Tools & Security: Git (version control), GitHub, Postman, OpenAPI, JWT, OAuth 2.0, bcrypt.

AI Tools: Lovable, Claude (AI-assisted frontend generation, codebase analysis and refinement).

EXPERIENCE

Backend Engineer March 2026 – Present

Gambus Energy Limited — Telematics Company *Remote*

- **CRM & Ticketing System:** Built the TypeScript (Node.js, Express) and MongoDB backend for a combined CRM and ticketing platform used by 50+ people, processing 100+ tickets per week and linking each ticket to its customer record.
- Enforced SLA deadlines on the server with overdue detection and escalation, and modelled the ticket lifecycle with state rules that reject invalid status changes.
- Secured the CRM with JWT authentication, bcrypt password hashing and role-based access control, with every ticket and customer change recorded in an append-only audit trail attributable to a user.
- **SIM Stock Inventory & Request System:** Built the TypeScript backend that tracks 500+ SIMs and handles SIM requests, modelling the SIM lifecycle as a state machine so a SIM can only move between valid states.
- Designed a two-factor handover for replacement requests: a replacement is only issued once the damaged SIM is physically returned, confirmed by a passcode that automatically records receipt, which stops replacements being issued without returns.
- Added strict RBAC for 10 users (tested with Postman), a lost/stolen flow and an admin override that requires mandatory audit logging, and customised the React frontend (from a Lovable AI-generated base) to fix workflow deviations, role-gating and UI issues.
- Ran unit and integration tests after development, documented the SIM portal API with OpenAPI, and deploy through GitHub Actions CI/CD pipelines with every change tracked in Git.

Technical Lead July 2026 – Present

Homelink — Lagos, Nigeria *Startup (PropTech)*

- Lead a 6-person team building the system for a PropTech startup that bridges renters and landlords, aligning engineering, product and business on technical execution.
- Led the backend architecture design for the MVP launch.
- Lead production and operational strategy, define processes and operational structure, and contribute to early-stage decisions, system architecture planning and platform scalability.

Full-Stack Engineer

Ecobus Transport Limited — Lagos, Nigeria *One-time Freelance Project*

- **Ecobus Data Centre:** Designed and built a unified data centre in TypeScript (Node.js, Express), React and PostgreSQL for 4 departments (Financials, Operations, Management and Administration), replacing spreadsheet and WhatsApp-based reporting and cutting daily reporting turnaround by an average of 7 hours compared with the old manual deadlines.
- **Financials & Payroll:** Automated daily reports from 10 terminals, with profit/loss calculated on the backend per terminal and company-wide, reports available daily, weekly, monthly and yearly, plus monthly payroll and staff records for 100+ staff and franchise reporting for 9 franchise owners at 20–22% monthly rates.
- **Operations:** Tracked 71 vehicles across 5 statuses with an approval workflow for repairs, and built duplicate detection that has blocked 50+ repeat repair requests in a month and alerts the operations and finance heads.
- **Access & Management:** Enforced RBAC across departments and management tiers, tested with Postman and secured with JWT, OAuth 2.0 and bcrypt, with a management portal for the CEO and Manager to view and query every department. Ran unit and integration tests after development.
- **Data & Reliability:** Partitioned the PostgreSQL database to keep queries and requests lean as the system scales, ran alerts as background jobs on Redis, and backed up the main database to both Cloudflare buckets and Backblaze, giving two independent off-site copies.
- **Frontend & Deployment:** Built the React frontend by customising a Lovable AI-generated base. Deployed with Docker, Nginx and PM2 through GitHub Actions CI/CD on Vercel and Render, using UptimeRobot to keep the free-tier Render server responsive within budget, with every change tracked in Git.

Technical Consultant October 2025 – December 2025

WitExpress — Lagos, Nigeria *Creative Agency*

- Designed a centralized database to manage an average of 200 clients, projects and creative strategies, with schema design and validation to keep the data accurate and reliable.
- Built backend services to track client engagement, campaign strategies and execution history, and optimized SQL queries to cut API response time by 40% on high-volume endpoints.
- Turned stakeholders’ operational workflows into structured backend systems, and built the agency’s official website with Lovable, featuring custom 3D animations, responsive interfaces and backend logic for dynamic content and service listings.
